                                                The present invention relates to human C35 (see AAG78997): C35 is a noverthemour antigen that is overexpressed in human breast and bladder carcinoma. C35 is thought to be a promising candidate for tumour immunotherapy, in immunogenic compositions and vaccines, to induce antibody and cell-mediated immunity against target cells such as tumour cells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Human; C35; cytostatic; gene therapy; vaccine; tumour antigen; breast cancer; bladder cancer; tumour immunotherapy; epitope; major histocompatibility complex binding peptide; MHC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to human C35 (see AAG78997).                                                                                                                immunotherapy, in immunogenic compositions and vaccines, to induce antibody and cell-mediated immunity against target cells such as tumour cells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.
                                                                                             Sequence
                                                                                                                                                                                                                                        and vaccines, for inducing antipody and voices C35 gene target cells, such as tumor cells that express C35 gene

The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to human C35 (see AAG78997). C35 is tumour antigen that is overexpressed in human breast and bladder carcinoma. C35 is thought to be a promising candidate for tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 04-APR-2001; 2001WO-US10855.

C35 is a nove tumour antigen that is overexpressed in human breast and bladder carcinoma. C35 is thought to be a promising candidate for tumour immunotherapy, in immunogenic compositions and vaccines, to induce antibody and cell-mediated immunity against target cells such as tumour cells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel C35 polypeptides and C35 genes useful in immunogenic compositions and vaccines, for inducing antibody and cell-mediated immunity against target cells, such as tumor cells that express C35 gene -
         The present invention relates to human C35 (see AAG78997). C35 is a tumour antigen that is overexpressed in human breast and bladder carcinoma. C35 is thought to be a promising candidate for tumour immunotherapy, in immunogenic compositions and vaccines, to induce antibody and cell-mediated immunity against target cells such as the antibody and cell-mediated immunity against target cells such as the
                                                                                                                                                                                                                                                                                                                                                                                                                                          Human; C35; cytostatic; gene therapy; vaccine; tumour antigen; breast cancer; bladder cancer; tumour immunotherapy; epitope; major histocompatibility complex binding peptide; MHC.

                                                                                                                                                    Sequence
                                                                                                                                                                     The present invention relates to human C35 (see AAG78997). C35 is a nove tumour antigen that is overexpressed in human breast and bladder carcinoma. C35 is thought to be a promising candidate for tumour immunotherapy, in immunogenic compositions and vaccines, to induce, antibody and cell-mediated immunity against target cells such as tumour cells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          epitope.

                                                                                                                                                                                                                                                                                                                                                                                     Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to human C35 (see AAG78997). C35 is a nove tumour antigen that is overexpressed in human breast and bladder carcinoma. C35 is thought to be a promising candidate for tumour immunotherapy, in immunogenic compositions and vaccines, to induce antibody and cell-mediated immunity against target cells such as tumour cells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility

                                              Novel C35 polypeptides and C35 genes useful in immunogenic compositions and vaccines, for inducing antibody and cell-mediated immunity against target cells, such as tumor cells that express C35 gene
                                                                                                                                                                                                                                                                                                    Human; C35; cytostatic; gene therapy; vaccine; tumour antigen; breast cancer; bladder cancer; tumour immunotherapy; epitope; major histocompatibility complex binding peptide; MHC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       immunotherapy, in immunogenic compositions and vaccines, to induce antibody and cell-mediated immunity against target cells such as tumour cells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention relates to human C35 (see AAG78997). C35 i tumour antigen that is overexpressed in human breast and bladder carcinoma. C35 is thought to be a promising candidate for tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Disclosure; Page 61; 331pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            tumour antigen that is overexpressed in human breast and bladder carcinoma. C35 is thought to be a promising candidate for tumour immunotherapy, in immunogenic compositions and vaccines, to induce antibody and cell-mediated immunity against target cells such as tumour cells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.
                                                                                                                                                         cells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.
                                                                                                                                                                                                              immunotherapy, in immunogenic compositions and vaccines, to induce antibody and cell-mediated immunity against target cells such as to cells that express C35 genes. The present sequence is a C35 peptide
                                                                                                                                                                                                                                                                                          The present invention relates to human C35 (see AAG78997). C35 is a novel tumour antigen that is overexpressed in human breast and bladder carcinoma. C35 is thought to be a promising candidate for tumour

                                                                                                                                                                                                                                                                                                  Query Match
                                                                                                                                                                                                                                                                                                                                                The present invention relates to human C35 (see AAG78997). C35 is a nove tumour antigen that is overexpressed in human breast and bladder carcinoma. C35 is thought to be a promising candidate for tumour immunotherapy, in immunogenic compositions and vaccines, to induce antibody and cell-mediated immunity against target cells such as tumour cells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          immunotherapy, in immunogenic compositions and vaccines, to induce antibody and cell-mediated immunity against target cells such as tumour cells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel C35 polypeptides and C35 genes useful in immunogenic compositions and vaccines, for inducing antibody and cell-mediated immunity against target cells, such as tumor cells that express C35 gene -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to human C35 (see AAG78997). C35 in tumour antigen that is overexpressed in human breast and bladder carcinoma. C35 is thought to be a promising candidate for tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Disclosure; Page 61; 331pp; English.

The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               tumour antigen carcinoma. C35
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Disclosure; Page 61;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         target cells, such as tumor cells that express C35 gene
                                                                      immunotherapy, in immunogenic compositions and vaccines, to induce antibody and cell-mediated immunity against target cells such as tunour cells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.
                                                                                                                                                  The present invention relates to human C35 (see AAG78997). C35 is tumour antigen that is overexpressed in human breast and bladder carcinoma. C35 is thought to be a promising candidate for tumour
                                                                                                                                                                                                                                              Novel C35 polypeptides and C35 genes useful in immunogenic compositions and vaccines, for inducing antibody and cell-mediated immunity against target cells, such as tumor cells that express C35 gene .
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Human; C35; cytostatic; gene therapy; vaccine; tumour antigen; breast cancer; bladder cancer; tumour immunotherapy; epitope; major histocompatibility complex binding peptide; MHC.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          immunotherapy, in immunogenic compositions and vaccines, to induce antibody and cell-mediated immunity against target cells such as tumour cells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       22-JAN-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to human C35 (see AAG78997). C35 in tumour antigen that is overexpressed in human breast and bladder carcinoma. C35 is thought to be a promising candidate for tumour the carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel C35 polypeptides and C35 genes useful in immunogenic compositions and vaccines, for inducing antibody and cell-mediated immunity against target cells, such as tumor cells that express C35 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        WO200174859-A2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention relates to human C35 (see AAG78997). C35 is a nove tumour antigen that is overexpressed in human breast and bladder carcinoma. C35 is thought to be a promising candidate for tumour immunotherapy, in immunogenic compositions and vaccines, to induce antibody and cell-mediated immunity against target cells such as tymour cells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.

tumour antigen that is overexpressed in human C35 (see AAG78997). C35 is a nov carcinoma. C35 is thought to be a promising candidate for tumour immunotherapy, in immunogenic compositions and vaccines, to induce antibody and cell-mediated immunity against target cells such as tumour cells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.
                                                                                                                                                                    Novel C35 polypeptides and C35 genes useful in immunogenic compositions and vaccines, for inducing antibody and cell-mediated immunity against target cells, such as tumor cells that express C35 gene -

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              antibody and cell-mediated immunity against target cells such as tumour cells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention relates to human C35 (see AAG78997). C35 i tumour antigen that is overexpressed in human breast and bladder carcinoma. C35 is thought to be a promising candidate for tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              and vaccines, for inducing antibody and cell-mediated in target cells, such as tumor cells that express C35 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel C35 polypeptides and C35 genes useful in immunogenic compositions and vaccines, for inducing antibody and cell-mediated immunity against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Disclosure; Page 61; 331pp; English.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                            The present invention relates to human C35 (see AAG78997). C35 is a nove tumour antigen that is overexpressed in human breast and bladder carcinoma. C35 is thought to be a promising candidate for tumour immunotherapy, in immunogenic compositions and vaccines, to induce antibody and cell-mediated immunity against target cells such as tumour cells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ABB12848 standard; Peptide; 15 AA.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The present invention relates to human C35 (see AAG78997). C35 is a nove tumour antigen that is overexpressed in human breast and bladder carcinoma. C35 is thought to be a promising candidate for tumour immunotherapy, in immunogenic compositions and vaccines, to induce antibody and cell-mediated immunity against target cells such as tumour cells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human; C35; cytostatic; gene therapy; vaccine; tumour antigen; breast cancer; bladder cancer; tumour immunotherapy; epitope; major histocompatibility complex binding peptide; MHC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Novel C35 polypeptides and C35 genes useful in immunogenic compositions and vaccines, for inducing antibody and cell-mediated immunity against target cells, such as tumor cells that express C35 gene -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               04-APR-2000;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 04-APR-2001; 2001WO-US10855.

                                                                    Novel C35 polypeptides and C35 genes useful in immunogenic compositions and vaccines, for inducing antibody and cell-mediated immunity against target cells, such as tumor cells that express C35 gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to human C35 (see AAG78997). C35 is a nover tumour antigen that is overexpressed in human breast and bladder carcinoma. C35 is thought to be a promising candidate for tumour immunotherapy, in immunogenic compositions and vaccines, to induce antibody and cell-mediated immunity against target cells such as tumour cells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (WHC) binding peptide.

                                                                                                                                                                                                               The present invention relates to human C35 (see AAG78997). C35 is a tumour antigen that is overexpressed in human breast and bladder carcinoma. C35 is thought to be a promissing candidate for tumour immunotherapy, in immunogenic compositions and vaccines, to induce antibody and cell-mediated immunity against target cells such as tuncells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       and vaccines, for inducing antibody and cell-wedlan target cells, such as tumor cells that express C35
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel C35 polypeptides and C35 genes useful in immunogenic compositions and vaccines, for inducing antibody and cell-mediated immunity against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; C35; cytostatic; gene therapy; vaccine; tumour antigen; breast cancer; bladder cancer; tumour immunotherapy; epitope; major histocompatibility complex binding peptide; MHC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             immunotherapy, in immunogenic compositions and vaccines, to induce antibody and cell-mediated immunity against target cells such as turcells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.

                                                                                                                                                                                                                                                                                                                                                                                                immunotherapy, in immunogenic compositions and vaccines, to induce antibody and cell-mediated immunity against target cells such as tumour cells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The present invention relates to human C35 (see AAG78997). C35 in tumour antigen that is overexpressed in human breast and bladder carcinoma. C35 is thought to be a promising candidate for tumour carcinoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      and vaccines,

The cells such as tumour antibody and cell-mediated immunity against target cells such as tumour cells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Novel C35 polypeptides and C35 genes useful in immunogenic compositions and vaccines, for inducing antibody and cell-mediated immunity against target cells, such as tumor cells that express C35 gene -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                04-APR-2000;

                                                                                 immunotherapy, in immunogenic compositions and vaccines, to induce antibody and cell-mediated immunity against target cells such as tumour cells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.
                                                           Sequence
                                                                                                                                                  The present invention relates to human C35 (see AAG78997). C35 is tumour antigen that is overexpressed in human breast and bladder carcinoma. C35 is thought to be a promising candidate for tumour

The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       immunotherapy, in immunogenic compositions and vaccines, to induce antibody and cell-mediated immunity against target cells such as tumour cells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The present invention relates to human C35 (see AAG78997). C35 is tumour antigen that is overexpressed in human breast and bladder carcinoma. C35 is thought to be a promising candidate for tumour
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            and vaccines, for inducing antibody and cell-mediat target cells, such as tumor cells that express C35
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel C35 polypeptides and C35 genes useful in immunogenic compositions and vaccines, for inducing antibody and cell-mediated immunity against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      04-APR-2000; 2000US-194463P

                                                                                                                                                                    The present invention relates to human C35 (see AAG78997). C35 is a nove tumour antigen that is overexpressed in human breast and bladder carcinoma. C35 is thought to be a promising candidate for tumour immunotherapy, in immunogenic compositions and vaccines, to induce antibody and cell-mediated immunity against target cells such as tumour cells that express C35 genes. The present sequence is a C35 peptide epitope. This peptide is predicted to be a major histocompatibility complex (MHC) binding peptide.
                                                                                                                                                                                                                                                                                                                                                                  Novel C35 polypeptides and C35 genes useful in immunogenic compositions and vaccines, for inducing antibody and cell-mediated immunity against target cells, such as tumor cells that express C35 gene -

LOCUS
DEFINITION

1809 bp cds.

mRNA linear F 8 (prostasin), clone

PRI 12-JUL-2001 MGC:2133

ACCESSION VERSION KEYWORDS

SOURCE ORGANISM Homo sapiens, protease, serine, IMAGE.3138532, mRNA, complete co BC001462 BC001462.1 GI:12655206 MGC.

Homo sapiens (human) Eukaryota; Metazoa; Chordata; Craniata; Vertebrata; Euteleostomi;

Primates;

Catarrhini; Hominidae;

 Clone distribution: MGC clone distribution information can be foun through the I.M.A.G.E. Consortium/LLNL at: http://image.llni.gov Series: IRAL Plate: 4 Row: j Column; 3
This clone was selected for full length sequencing because it passed the following selection criteria: matched mRNA gi: 11.43193.

Alamos National Laboratory.
 AC009088 127769 bp DNA linear PRI 29-MAR-2003
Homo sapiens chromosome 16 clone RP11-388M20, complete sequence.
Quality: Phrap Quality >=40 99.7% of Sequence;
Estimated Total Number of Errors is 0.2.

MOTE: This insert is not the entire sequence of the clone (entire sequence is 233.48b). It is clipped at the overlap with AC135050. The number of bases overlapped is 2575.

 Conservative
 anonymous pool of 24 week female lung, 16 week female spleen, and 20-22 week male spleens. Library is ollgo-dT primed and directionally cloned (EcoRV site is destroyed upon cloning). Average insert size 1.4 kb, insert size range 1-3 kb. Library is normalized and enriched for full-length clones and was constructed by C. Gruber (Invitrogen). Research Genetics tracking code 026. Note this is a NIH MGC Library."

 AAC77607 to AAC78448 encode the human cancer associated proteins given in AAB43398 to AAB44239. The proteins can have activities based on the tissues and cells the genes are expressed in. Example of activities include: Cytostatic; proliferative manufactures immunomodulator;
 Novel isolated nucleic acids comprising sequences encoding peptides useful for treating or diagnosing e.g. cancer -

 is afflicted with ovarian cancer by comparing: (1) the expression of a marker (1) (see AAF98594 to AAF98730), in a patient sample, and (2) the normal level of expression of (1) in a control non-ovarian cancer sample, where a significant difference between the level of expression in (a) and (b) is an indication that the patient is afflicted with ovarian cancer. (1) have cytostatic activities and can be used in antisense gene therapy. The method, compositions and kits from the present invention can be used for: (1) assessing and treating ovarian cancer; (2) making isolated hybridoma, which produces an antibody useful for ovarian cancer assessment; and (3) inhibiting ovarian cancer in a patient. AAF98573 to AAF98593 represent human kinase marker primer; and probes which are used in the exemplification of the present invention.

 The invention relates to a gene expression profile comprising one or more genes (ABZ34889-ABZ35692) and generated from a cell type. The cell type is a coronary artery endothelium, umbilical artery or vein endothelium,
 New gene expression profile generated from primary, endothelial, epithelial, and muscle cell types, useful for identifying diseas pathologies involving alterations of gene expression, e.g. cance

from Assessing whether a patient is afflicted with ovarian cancer, useful in assessing the stage or progression of the disease, comprises comparing the expression level of a cancer marker in a sample from a patient and മ non cancer patient

Disclosure; Page 384; 481pp; English.

cc patient is afflicted with ovarian cancer. The method involves comparing ct the expression level of a marker in a patient sample and the normal level of expression of the marker in a control non-ovarian cancer sample, where ct the marker is selected from 363 cancer markers described in the greenfication. The method of the invention is useful in diagnosing or characterising cancer, in detecting the presence of cancer as early as composible, and the recurrence of ovarian cancer. The method may also be of particular use with patients having an enhanced risk of developing covarian cancer (e.g. patients having a familial history of ovarian cancer.) The cancer markers may be used in the management and treatment of e.g. brain and central nervous system disorders (e.g. bacterial and context of e.g. brain and central nervous system disorders (e.g. bacterial and confers) and contral meningitis or encephalitis), confident of e.g. bacterial or viral meningitis or encephalitis), confident of disorders (e.g. nontuberculous granulomatous orbitis), confidential disorders (e.g. nontuberculous granulomatous orbitis), confidential cancer (e.g. nontuberculous granulomatous orbitis), confidential cancer (e.g. nontuberculous granulomatous orbitis), confidential cancer, monitoring the progression of ovarian cancer, determining whether ovarian cancer has metastasized or is likely to assessing the ovarian cancer has metastasized or is likely to assessing the ovarian cancer notential of a composition of context of concerns and cancer, contexting a composition for inhibiting ovarian cancer, assessing the ovarian carcinogenic potential of a compound, or inhibiting ovarian cancer or at risk of developing ovarian cancer mapresent nucleic acid sequence encodes one of the ovarian cancer mapresent nucleic acid sequence encodes one of the ovarian cancer mapresent nucleic acid sequence encodes one of the ovarian cancer mapresent nucleic acid sequence encodes one of the ovarian cancer mapresent nucleic acid sequence encodes one of the ovarian cancer mapresent nucleic acid sequences on the ovarian cancer mapresent nucleic acid sequences on the ovarian cancer mapresent nucleic acid sequences on the ovarian cancer mapresent nucleic acid sequences on the ovarian cancer mapresent nucleic acid sequences on the ovarian cancer mapresent nucleic acid sequences on the ovarian cancer mapresent nucleic acid sequences on the ovarian cancer mapresent nucleic acid sequences on the ovarian cancer mapresent nucleic acid sequences on the ovarian cancer mapresent nucleic acid sequences on the ovarian cancer mapresent nucleic acid sequences on the ovarian cancer mapresent nucleic acid sequences on the ovarian cancer mapresent nucleic acid sequences on the ovarian cancer mapresent nucleic acid sequences on the ovarian cancer mapresent nucleic acid sequences of the ovarian cancer mapresent nucleic acid sequences of the ovarian cancer mapresent nucleic acid sequences of the ovarian cancer mapresent nucleic acid sequences of the ovarian cancer mapresent nucleic acid sequences of the ovarian cancer mapresent nucleic acid sequences of the ovarian cancer mapresent nucleic acid sequences of the ovarian cancer mapresent nucleic acid sequences of the ovarian cancer mapresent nucleic acid sequences of the ovarian cancer mapresent nucleic acid sequences of the ovarian cancer mapresent nucleic acid sequences of the ovarian cancer mapresent nucleic acid sequences of the ovarian cancer mapresent nucleic acid sequences of the ovarian cancer mapresent nucleic acid sequences of the ovarian cancer mapresent nucleic acid sequences of the ovarian described present invention relates to a new method for assessing in the invention. whether markers The

Diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver tumor in a patient, involves detecting the level of expression of two or more genes in ciagne sample

Claim 1; SEQ ID NO 2214; 298pp; English.

The invention relates to a novel method for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma or metastatic liver cumour in a patient, and differentiating metastatic liver cancer from the hepatocellular carcinoma in a patient, involving detecting the level of expression of two or more genes represented in ABM93503-ABM97455 in a cc tissue sample. The method of the invention has hepatotropic, and cc cytostatic activity. The method is useful for diagnosing and detecting the progression of liver cancer, hepatocellular carcinoma and metastatic cliver carcinoma in a patient. The method is useful for identifying cexpression profiles which serve as useful diagnostic markers as well as can be used to monitor disease states, disease progression, cc drug toxicity, drug efficacy and drug metabolism.

```
This invention relates to a novel method for determining if a human has, or is likely to develop, a malignant growth. The method comprises measuring the concentration of prostatin as protein or mRNA, in a sample and comparing the result with one or more controls, where a level of prostatin expression that is significantly higher than in controls is indicative of cancer, or increased susceptibility. The assay is specifically used to detect ovarian cancer or a predisposition to it, but may also be applicable to breast, prostatic, lung and colonic cancers. Using the method of the invention it was shown that in ovarian cancers, the highest levels of prostatin were found in stage II disease, suggesting that this marker is suitable for early detection. The pretein used in the method of the invention as a marker for early cancer or susceptability to cancer.

The present invention describes a method (M1) for screening for an CC anti-neoplastic agent. The method involves exposing cells to a chemical capent to be tested for anti-neoplastic activity, determining a change in CC expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 8447 sequences (given in ABL61664 Ct to ABL70110), or is at least 95% identical to (S), where a change in CC expression is indicative of anti-neoplastic activity. (I) has cytostatic cartivity and can be used in gene therapy. M1 can be used for screening CC an anti-neoplastic agent, and can be used for producing a product which is the data collected with respect to the anti-neoplastic agent as a CC result of M1, and the data is sufficient to convey the chemical CC treatment of cancer such as colon, bereat, stomach, lung, thyroid, CC cosponageal, ovarian, kidney, prostate or pancreatic cancer, capenings colon; activity at the data cancer, squamous cell cancer, infiltrating ductal cancer, infiltrating lobular cancer, acroinma and wilm's theory.

 The present invention describes a method (M1) for screening for an anti-neoplastic agent. The method involves exposing cells to a chemical comprise to be tested for anti-neoplastic activity, determining a change in expression of at least one gene (I) of a signature gene set, where (I) comprises a sequence (S) selected from 847 sequences (given in ABJ,61664 to ABJ,0110), or is at least 95% identical to (S), where a change in expression is indicative of anti-neoplastic activity. (I) has cyrostatic activity and can be used in gene therapy. M1 can be used for screening an anti-neoplastic agent, and can be used for producting a product which is the data collected with respect to the anti-neoplastic agent as a cresult of M1, and the data is sufficient to convey the chemical costructure and/or properties of the agent. M1 can be used in the treatment of cancer such as colon, breast, stomach, lung, thyroid, coseophageal, ovarian, kidney, prostate or pancrestic cancer, infiltrating lobular cancer, squamous cell carcinoma, neuroendocrine carcinoma, papillary carcinoma and Wilm's tumour.

 The present invention describes a method for assessing whether a patient is afflicted with ovarian cancer by comparing: (1) the expression of a marker (I) (see AAF98594 to AAF98730), in a patient sample; and (2) the normal level of expression of (I) in a control non-ovarian cancer sample, where a significant difference between the level of expression in (a) and (b) is an indication that the patient is afflicted with ovarian cancer. (I) have cytostatic activities and can be used in antisense gene therapy. The method, compositions and kits from the present invention can be used for: (1) assessing and treating ovarian cancer; (2) making isolated hybridoma, which produces an antibody useful for ovarian cancer assessment; and (3) inhibiting ovarian cancer in a patient. AAF98573 to AAF98593 represent human kinase marker primers and patient. AAF98573 to AAF98593 represent human kinase marker primers and

 The invention comprises a method for assessing whether a patient is afflicted with breast cancer or ovarian cancer. The method involves the use of specific DNA markers. The method of the invention is useful in th detection and treatment of ovarian and breast cancer. DNA sequences ABT31894 - ABT31949 encode human breast/ovarian cancer-related proteins.

 The present sequence is a coding sequence for a NOV protein. The NOV proteins and coding sequences are useful for treating or preventing NOV-associated disorders or in the manufacture of a medicament for treating the disorders, such as cancer, heart disease, inflammation, autoimmune disorders, allergies, blood disorders, AIDS, diabetes, obesity, asthma, IgA nephropathy, cirrhosis, arthritis, Alzheimer's disease, infections (e.g. bacreial, viral, parasitic), stroke, muscular dystrophy, epilepsy, and other wasting disorders associated with chronic diseases. NOV14a is a prostasin-like protein, and the NOV14a coding sequence localises to chromosome 16p11.2.

 CC The present invention describes polypeptides (I) which bind to the CC cytoplasmic domain of the advanced glycation end-product (AGB) receptor CC (also known as RAGB), either directly or indirectly, and inhibit the CC signal transmission from the binding of RAGB with its ligand to the CC activation of nuclear factor kappa beta (NFkbeta). Also described: CC (1) polynucleotides encoding (I); (2) expression vectors containing CC polynucleotides encoding (I); (3) microorganisms and cells transformants; (CC type there vectors; (4) preparation of (I) by culture of the transformants; (5) gene therapy drug compositions.containing vectors for expression of (I) in animals; (6) screening compounds inhibiting or promoting the CC type polynucleotides are groupounds identified by this screening method; (7) compounds identified by this screening method; (8) antibodies recognizing all or part of (I); (1) polynucleotides at least 20 bases in length, hybridising to all or compounds containing to all or part of the polynucleotides, and diagnostic reagents containing them. (I) have contained to the containing them. (I) have contained to the cell via RAGE and for gene therapy. AGE are sugar reaction; contained with amine groups which accumulate in association with diabetes, and the regulation of AGE signal transmission contained with anine groups which accumulate in association with diabetes, and contained the containing them the contained with diabetes.

Claim 9; Page 100; 358pp; English.

The present sequence is an insert assembly sequence for NOV14a protein. NOV14a is a prostasin-like protein, and the NOV14a coding sequence localises to chromosome 16. The NOV proteins and coding sequences of the invention are useful for treating or preventing NOV-associated disorders or in the manufacture of a medicament for treating the disorders, such a cancer, heart disease, inflammation, autoimmune disorders, allergies, blood disorders, AlDs, diabetes, obesity, asthma, IgA nephropathy, cirrhosis, arthritis, Alzheimer's disease, infections (e.g. bacterial, viral, parasitic), stroke, muscular dystrophy, epilepsy, and other wasting disorders associated with chronic diseases. disorders of the as
